

## Cleaning Cloths and Similar Products

### Objective:

Testing of significant, quality-relevant characteristics of cleaning cloths and similar products.

### The test is particularly well-suited for:

- Cleaning cloths made of textiles
- Cleaning sponges/pot and pan cleaners
- Items made of combined materials
- Other items upon inquiry

### Description:

The key characteristics of cleaning cloths and similar products such as cleaning sponges, pot and pan cleaners and additional products can be either tested on absolute terms and/or with respect to certain quality requirements. Typical characteristics for textile items are, e.g., qualitative and quantitative material composition, fiber substrate, grammage, dimensions, workmanship, dimensional changes/maintainability, water absorbency, presence of optical brighteners. Sponges can also be tested for product-specific properties such as foam density.

If available, the tests are carried out on the basis of official standards (e.g. DIN). In addition, house testing methods can also be applied.

### Advantages for you as the customer:

- Impartial evidence of quality for your customers
- Comparison with specifications
- Internal quality control
- Direct comparison with competitors

### Labels and certificates:

No independent label or certificate planned.

### Requirements for test samples:

#### General information:

- No specific requirements

#### Amount of material:

- Dependent upon the type and scope of tests

#### Duration of testing:

- Dependent upon the type and scope of tests
